

Tomorrow's standard solution for life and pension

FACT SHEET

LIFELINK is the unifying and thoroughly tested standard solution for managing the insurance policies of life insurance and pension companies. The system supports the entire value chain from the first contact with a customer to the creation of a contract, the handling of policies and the management of disbursement.

LIFELINK Features

LIFELINK has been developed based on Edlund's close cooperation with pension companies and experience from the common working processes within the life insurance and pension industries. LIFELINK supports market yield, life cycle products, average yield and unit-linked products in a single solution. LIFELINK consists of a number of standard modules for the management of contracts and policies with the involved processes, payment and disbursement as well as workflows and standard integration with regulatory bodies.

Flexible standard

Standard modules typically account for 80-85% of the final solution. In close cooperation with the customer, the remaining customer-specific part of the solution is customised in separate programming modules. The modules are integrated to ensure a reliable solution that reduces per-policy costs significantly. LIFELINK can be fully integrated with the customer's specific system landscape via system integration and web services.

Value for money

LIFELINK has been developed focusing on quality and reliability in calculations and projections, high performance and a user-friendly interface. We offer highly cost-efficient maintenance and upgrading of the standard system resulting in a significant reduction in TCO.

- Fully integratable standard solution
- Low TCO
- Standard solutions and processes
- Cost-efficient maintenance and development
- Scalable solution
- High degree of computerised business processes
- Upgradable technology

Technology

LIFELINK is a three-level solution consisting of a data level, a server level and a client level. All calculations, validations and other business logic are handled at server level, whereas the client is dialogue-based and highly user-friendly in the well-known Windows interface. The system is 100% based on .NET components, and the standard module is upgraded twice a year to reflect legislative amendments and to provide new functionality requested by the industry.
